                  Determination of this BAC-ded sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutovyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; on bw 3p, the same strain was don't the BDGP's and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Drosophila melanogaster genome survey sequence TET3 end of BAC: BAC: BAC: SACR32N04 of RPCI-98 library from Drosophila melanogaster (fruit lly), genomic survey sequence.

melanogaster genome using these BACS. For further information please see http://www.fruitfly.org The BDCP Drosophila melanogaster BAC library was prepared by Kazucoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial ECORI digestion of Drosophila DNA provided by the BDCP from the isogenic strain y2; cn bw sp, the same strain used for the BDCP's pland EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library and how to order individual BAC clones, the entire library confilters for hybridization from the BACPAC Resource Center can be location/Qualiflers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CNSOODKY 928 bp DNA GSS 04-JUN-1999

Determination of this BAC-end sequence was carried out as part of collaboration of this BAC-end sequence was carried out as part of collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC ibbrary was prepared by Razucoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Instituted by partial NY. The ibbrary is named RPCI-99 and was confirmed by partial EcoRI digestion of forosophila DNA provided by the BDGP from the isogenic strain y2: on bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library, and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

Determination of this BAC-end sequence was carried out as part of collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP prosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial ECORI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2: cn bw sp, the same strain used for the BDGP's Pl and bST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library.

Gilters for hybridization from the BACPAC Resource Center can be contain at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

Determination of this BAC-end sequence was carried out as part of a
                                                                                                                                                                            collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGM Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pleter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Drosophila melanogaster genome survey sequence TET3 end of BAC # BACN0109 of RPCI-98 library from Drosophila melanogaster (fruit fly), genomic survey sequence.
                                                                                                                                                                                                                                                                                                                                                                                     and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                                    and EST libraries. A more detailed description of the library
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ttttaagatattaattaattaaaagatttttttaaaaaatgtataaaattata 142

Determination of this BAC-end sequence was carried out as part of collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jons's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digastion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's pl and by to order individual BAC clones, the entire library and how to order individual BAC clones, the entire library or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

                                                                Disclosure: Figure 12: 149pp; English.

A polypeptide comprising a Plasmodium falciparum (Pf) erythrocyte membrane protein (PfEMPI) or active fragments or analogues of that protein can be used in the treatment or prevention of symptoms of a malaria parasite infection. The polypeptides can inhibit, block or reverse the sequestration of erythrocytes in patien, suffering from malaria. Nucleic acids derived from the PfEMPI gene can be used as probes and primers to identify a Plasmodium falciparum parasite, the primers used to generate characteristic amplification patterns from different P. falciparum strains. Antibodies specifically immunoreactive with the PfEMPI polypeptide or its fragments may be used in diagnosis of malaria infection. This sequence encodes the pfEMPI protein of the MC type of Plasmodium falciparum. An
                                                                                                                                                                                                                                                                                                          Gaps

```
This is the nucleotide sequence of one strand of the PSI-PL470
gene of the 30.7 kb extrachromosomal plastid of Plasmodium berghel.
This plastid encodes organelle-like rRNAS, tRNAS, trNAS, ribosomal
proteins and RNA polymerase subunits, amongst others. Plasmodium is
cletected in a human or animal sample by treating it, or derived
cucleic acid, with a Plasmodium extrachromosomal genetic element or
derived nucleic acid (A) and detecting any hybridisation. (A) can
include the PSI-PL470, PLH-PPH, PRB or PWO gene, the mitochondrial
cori gene, and nucleic acids derived from them. Also new are
include the PSI-PL470, PLH-PPH, PRB or PWO gene, the mitochondrial
cori gene, and nucleic acids derived from them.
Also new are
(A)-Specific probes and primers (see V33139-56). The method is
used to diagnose Plasmodium infection. Also (not claimed) the
cused to diagnose Plasmodium infection. Also (not claimed) the
cused to development of an anti-malaria vaccines. The high
development and for development of anti-malaria vaccines.
Cevelopment of genus- or species specific assays that result in
fewer false negatives than known methods (typically 1% against 3%).

Claim 4: Page 56-61; 96pp; English.

This sequence represents the var-7 gene of Plasmodium. Var-7 belongs to This sequence represents the var-7 genes which have homology to the Duffy binding like (DBL) family of genes which have homology to the Duffy antigen binding protein (DABP) and sialic acid binding protein (SABP) conserved regions (see T72889 and T72888 respectively). The var family of genes modulate cytoadherence and antigenic variation of Plasmodium infected erythrocytes. SABP and the Duffy antigen binding protein (DABP) are soluble proteins that appear in the culture supernatant after infected erythrocytes release merozoites. DABP and SABP mediate the binding of merozoites and schizonts to the erythrocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         plasmodium var-7 gene.

The Pythium isolates are used to control fungi, specifically pathogenic Pythium species (but possibly also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI: 98-250977/22.
Controlling phytopathogenic organisms with non-pathogenic Pythium Lisolate - for control of damping off caused by Pythium claim 17; Page 30; 41pp; English.
This is a partial nucleotide sequence of the mitochondrial DNA from a Pythium oligandrum isolate 23-5. Nucleotide sequences which are inverted repeats, flanked by PstI restriction sites from mitochondrial DNA from various P. oligandrum isolates are shown in V29576 to V29583. These Pythium isolate sequences are non-pathogenic and can be used in a method for controlling phytopathogenic organisms where the organisms are method for controlling phytopathogenic organisms where the organisms are
parasite. This sequence can be used in the compositions of the invention. The compositions are for the treatment and prevention of malaria, and comprise either a nucleotide sequence or encoded polypeptide of the var-1, var-2, var-3 or var-7 genes of the DBL gene family, a family of genes having homology with conserved regions of DABP and SABP. The compositions are used for the treatment and prevention of malaria. They are also used in the preparation of vaccines for inducing a protective immune response in a mammal to Plasmodium merozoites (especially Plasmodium faliciparum or Plasmodium vivax).

other soil-borne pathogens), particularly for protecting plants (seedlings, transplants or vegetable crops such as tomatols gathist damping off, especially after transplanting into open fields. The isolate sequences are useful as sources of probes for identification of particular isolates. The isolates are widely distributed in mature, with a similar ecology to pathogenic species. They produce large quantities of cospore inoculum on liquid or solid substrates and are tolerant of several commonly used fundicides. A single application at the greenhouse stage will protect plants after transplanting.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated Borrella burgdorferi nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and therapy of infections, particularly Lyme disease claim 1; Page 801-831; 1128pp; English.

X20248 to X20402 represent polynucleotide sequences isolated from portable burgdorfer! (Bb). Products derived from Bb can be used for the detection, diagnosis, characterisation, prevention and therapy of Bb infections, e.g. Lyme disease. They can also be used for the production of blosynthetic products, e.g. enzymes. Borrella belongs to a family of motile, spiral-shaped bacteria called Spirochetes. Spirochetes are pathogenic in humans and Borrella causes epidemic and

Human apolipoprotein B (apoB) scaffold attachment region (SAR) element clones RN32 (731530) and RN10 (731531) respectively carry the 3; human apoB SAR element and the distal 1212 bp 5; human apoB SAR element and the special special proximal sequence. These SAR elements
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SAR element and 1317 by proximal sequence. These SAR elements co-map with the boundaries of the human apoB gene chromatin domain. A novel recombinant DNA molecule adapted for transfection of a host cell comprises an erythropoietin (EPO) cDNA (131529) or genomic clone (131512) operably linked to an expression control sequence and to the 5' and 3' SAR elements. The SAR elements increase expression of the recombinant EPO in stable, long-term

Products derived from Bb can be used for the detection, diagnosis, charctisation, prevention and therapy of Bb infections, e.g. Lyme disease. They can also be used for the production of biosynthetic products, e.g. enzymes. Borrella belongs to a family of motile, spiral-shaped bacterial called Spirochetes. Spirochetes are pathogenic in humans and Borrella causes epidemic and endemic relapsing fever, and Lyme borrellosis, more commonly known as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     196 cttaaaaaaatgttgcaagacacttattagacatagtcttgttctgtttacaaaagcattc 255

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             10 teacateceaaacataacatggatateteettaeceaateataetaattatttgggttaaa 69
                                                                                                                                                                         New recombinant DNA encoding Orpinomyces cellulase protein - useful for, e.g. producing recombinant Orpinomyces cellulase in host cell claim 5; Page 38-40; 69pp; English.

This cDNA clone includes a claimed coding region for cellulase celB (see W56742) of the anaerobic bovine rumen fungus Orpinomyces sp. PC-2. It was obtained by screening a PC-2 cDNA library for clones
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New recombinant DNA encoding Orpinomyces cellulase protein - useful
                                                                                                                                                                                                                                                                                                                                                                        active on remazol brilliant blue-carboxymethylcellulose. The encoded cellulase has endoglucanase, but not cellobiohydrolase, activity. CelA and celC genes (see V29472-73), also obtained from Orpinomyces sp. PC-2, encode cellulases having both activities (see W56738-39). Recombinant DNA molecules encoding Orpinomyces cellulase proteins are claimed, as well as recombinant cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Aspergillus, Trichoderma reesei, Pichia, Penicillium, Streptomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

for, e.g. producing recombinant Orpinomyces cellulase in host cell
Claim 5; Page 38-40; 69pp; English.
This cohna clone includes a claimed coding region for cellulase celB
(see W56742) of the anaerobic bowine rumen fungus Orpinomyces sp.
PC-2. It was obtained by screening a PC-2 cDNA library for clones
c active on remazol brilliant blue-carboxymethylcellulose. The
encoded cellulase has endoglucanase, but not cellobiohydrolase,
c activity. CelA and celC genes (see V29472-73), also obtained from
C Orpinomyces sp. PC-2, encode cellulases having both activities
C see W56738-39. Recombinant DNA molecules encoding Orpinomyces
C claulase proteins are claimed, as well as recombinant cells
c selected from Saccharomyces cerevisiae, Escherichia cellulase
C Spergillus, Trichoderma reesei, Pichia, Penicillium, Streptomyces
or Baccillus, and a method for producing recombinant cellulase by
C culturing these host cells.

The CDNA encodes a profein that includes 2 insert sequences not found in other CPSII proteins. The first separates the putative structural subdomain and the glutaminase subdomain of the glutaminase subdomain of the glutamine-amidotransferase subunit of CPSII, while the second separates 2 ATP binding subdomains of the

New gene encoding Plasmodium falciparum 140 kD antigen - and new fusion Disclosure; age 9; 18pp; german. proteins, transformed cells and antibodies, useful in malaria vaccines;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            diagnosis, etc.

The 140 kD antigen of Plasmodium falciparum merozoites encoded by this sequence can be used in malaria vaccines, and antibodies raised against it are useful in passive immuno-prophylaxis. The antibodies, nucleic acids and proteins are also useful as diagnostic agents, and the antibodies may be used for the recovery of high-purity proteins. See also N81155-56.

Recombinant vector encoding hybrid Ompa protein of Salmonella for prodn. of Orally-administered malaria vaccines
for prodn. of Orally-administered malaria vaccines
for prodn. of Orally-administered malaria vaccines
To construct pompa-5. pugle-SERP which carries the complete SERP gene
on a 5.8 kb XbaI fragment (Knapp et al., Mol. Biochem. Parasitol. 32
(1989), 73-84) was digested with KpnI and PStI. A 1.3 kb DNA fragment
(see features) was isolated and ligated into the respective sites of
pSK vectors. Subcloning of the SERP fragment into pSK was performed
in order to create the correct translational reading frame at the 3'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SERP coding region. The resulting plasmid pSK SERP was 1th Smal and KpnI, the 1.3 kb fragment was isolated and the respective sites of pHSI64L. d pomper 7 both encode 451 amino acids of the SERP antigen, 3975 BP; 1690 A;

Contains ESTS, STSS and ara; Vertebrata; Mammalia; linidae; Homo.	Direct Submission L Submitted (07-MAY-1998) sanger.ac.uk/HGP/Chr6/) Sanger Centre, Hinxton, Cambridgeahire, Canglo 15A, UK. E-mail enquires: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk On May 18, 1998 this sequence version replaced gi:2909620. IMPORTAMY: This sequence is the entire insert of clone 352A20. IMPORTAMY: This sequence is the entire insert of clone 352A20. During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variations annotated may not be found in the sequence submission corresponding to the overlapping clone as we submit sequences with only a small overlap as described above. This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Centre chromosome 6 mapping group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr6/ This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key. The true left end of clone 352A20 is at 1 in this sequence. The true right end of clone 352A20 is at 144759 35A20 is from the library RPCI3 constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong. For further details see http://bacpac.med.buffalo.edu/. 1.144759

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Submitted (14-FEB-2000) Whitehead Institute/MIT Center Research, 320 Charles Street, Cambridge, MA 02141, USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NOTE: This record contains 55 individual sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be generich and allows

On Feb 7, 2000 this sequence version replaced gi:6911915.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with a mail overlap as described above.

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence is the entire insert of clone RP5-1108D11 The true left end of clone RP3-495O3 is at 114928 in this sequence. The true right end of clone RP5-1183121 is at 707O3 in this sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             http://www.sanger.ac.ur/microsoft.20
RP5-1108D11 is from the library RPCI-5 constructed at the Roswell
Park Cancer Institute by the group of Pleter de Jong. For further
